Uwe,

Can HDDriver work with EmuTOS?

- Andy Ball

Andy Ball wrote:

> Can HDDriver work with EmuTOS?

I don't know if it works or if it makes sense at all (I don't know/use
EmuTOS), but you can simply check it with the demo version of HDDRIVER.

The Anodyne driver is not compatible with HDDriver 8.11. Try an
older HDDriver. I use 7.93.

Does anybody know any web sites with VME information, such as pinouts
etc. I am toying with the idea of a small project for the MegaSTE, but
need to know more about it.

Found this too, cool.

http://www.dansdata.com/cfide.htm

Food for thought.

Mark

I have been given an old stacy.

I would like to take the case off, but after removing the screws it still
seems to be held together near the handle.

Anyone know the secret to this?

On google I see lots of references to STacy, but how about any sites that
have pictures of the things inside?

Q)

I just changed the batteries on my Mega ST the for real time clock.
It doesn't seem to keep the time I set though, is there an auto folder
prg or something?
When I use UVK I have to set the date everytime. :(

Is there anyway around the two digit year in the control panel?
I use Neodesk 4 with it's neocntrl panel as an ACC.

Thanks,

Bud

```
While using my ST, I wrote a little GFA program to set the state
automatically into the autofolder. It was real simple - basically just added
100 years onto the current date - bypassed the control panel 2 digit date
thing completely.

Just an idea for you:)

Here's my setup:

Atari 1040 STe (4 MB) TOS 1.06
ICD The Link 2
HDDriver Version 8.02
Atari ACSI 00:00 Quantum LP40S
Atari ACSI 01:00 Quantum LP80S
Atari ACSI 05:00 Iomega ZIP 100
Partitions: CDE

I can format and partition the ZIP OK.
When I double click the E:ZIP Icon no window opens!
I CAN open a ZIP disk that was formatted/partitioned with ICD utilities.
Help PLZ!

Do you have that ZIP drive at the end of the chain? I have one on a TT at the end of a SCSI chain, and the termination on that thing is somehow intermittent and variable, and will soon be replaced with an adapter and an active terminator.

I would suggest that you put the zip earlier in the chain, and am presuming that the Quantum drives have good termination.

If that does not work, you have another problem, and I am clueless as to what that might be.

Jim

Have you told HDDRIVER about ACSI 05:00? Presumably so, else you wouldn't be able to open the ICD Utils-formatted disk. To be sure, use Settings/Devices & Partitions (or ^C) and make sure it is enabled. Or use Tools/Auto Configuring (or ^A).

What settings did you use for formatting/partitioning the ZIP? Normally formatting is not necessary, unless there are many bad sectors - partitioning is enough. Try repeating that on the disk.

Regards, /Peter/

Hi Steve!

Yep - just double-checked HDDRUTIL.APP - Uwe used Alt shortcuts for 9 menu entries, but Control for the remaining 16. Since no copy functions are involved, I'm not sure it matters, as long as the shortcut is shown in the menu.

In general, I am always surprised that people run out of shortcut letters, but very seldom resort to number combinations. In fact the only one I can think of is my translation of Egale, where I used ^1 for 'Find first' (as the German shortcut wasn't logical).

Incidentally, Egale is a rare example where shortcuts can be changed in the RSC (say with a hex editor) and are recognised by the program.

Regards, /Peter/

Sure, but some should beconsidered as reserved, especially obvious one's
like this..

>prg or something?

Once you set a clock through a suitable utility, you do not need anything more- it should keep the time for several years.

It may be that the clock doesn't get power for some reason- if the previous set of batteries had leaked, maybe the contacts in the battery housing are bad- or maybe the wires going from the housing to the motherboard disconnected (maybe corroded by the leaking batteries)- you can lift the cover of the Mega's box to check if both wires of the cable are still soldered to pads on the battery housing, the other end of the cable connected to a small connector on the motherboard shielding, and both wires in a cable going from that connector soldered to the motherboard.

On the other hand, it is true that I had once a problem with the real-time clock on my Mega. Strangely enough, it was caused by a faulty supply-voltage monitor chip (TL7705) on the motherboard- it did not create a proper reset signal on powerup, and sometimes the clock got loaded with garbage data. If the clock doesn't get the power, upon each powerup (after a few minutes in off state, there is a fairly large capacitor near the clock) it will show always the same (wrong) time. If there is an error like the one I described, the time set will be something random.

Can someone let me know if it's possible to convert this mouse for use with my Mega STE Atari?

It only says Commodore Made in China. If possible, will someone have a diagram?

http://www.paraisocz.com/cmouse.htm

Thanks
Dave

If possible can I be emailed at drdave@paraisocz.com

I am not sure if the forum will notify me of a reply.

Thanks again
Dave

If you search the net you will find that its a simple case of swapping two pins in the wire.

Coda.

Yes the Mega and TT030/MegaSTE use the same keyboard connector.

Yes these dealers are expensive. I ended up buying a New In Box TT030
keyboard for my T030 for $125 from Best. IMHO it was worth it.

Tim

I would think it would be possible if you now what you are doing.

A friend of mine took a Deca mouse and made it compatible with my STe.

Hi. I've got a Mega ST4, Adspeed, that I've been slowly rejuvenating over the last couple of weeks. I'm having a problem with the disk drive. When I boot up, the light comes on, noise is made, and I get the desktop (I've also got a 4 gig HD hooked up, it boots up to it just fine). However, it wont' read any floppy disks I have, doesn't matter whether its a game or formatted disks of my own. These disks I can read just fine from other machines.

So. I cleaned it, took the comp apart, checked connections (power, drive cable) and did the 6" drop procedure. Still the same.

So (part 2) :-)... I ordered a new replacement drive from Brad at Best Electronics. The old drive is an Epson 480, the new drive is an Epson 380 - both have the 5/8 inch eject button.

I simply replace the old drive with the new one. Boot up. Hmm, no lights come on, no sound...and finally, no icons on the desktop. I boot up from hard drive and click the floppy A icon. It says that drive is non existent, or something like that.

TOS reports it like that, Neodesk reports it like that, etc, etc...

Any ideas anyone? Is there a jumper I'm supposed to set on the new drive?

Thanks for any input.

That can be one of life's great mysteries. It may go away of its own accord. Depending on which hard disk driver you use, it may also run the floppy drive, and be confused. That sort of thing has happened to many people, and led to the replacement of good drives.

Might try re-installing the driver, or what has been called a stone cold reboot, leaving the machine off for 20 minutes.

The cable is right side up, is it not?

Jim

Hi Jim. Thanks for the reply. Well, I guess I didn't make it very clear in my first post, but with the HD (Link 2, HDDriver, Seagate 4 gig HD) not even connected to the Mega I'm having these problems. With a bare machine, booting up, the floppy disk drive is not recognized, and I get a TOS desktop with no floppy A or B icons. It kind of reminds me of when I first got a 520ST years ago, before I got an external floppy drive for it. :-)

I put the old floppy drive back in, booted up, lights do come on, floppy drive makes noise, and I get the standard TOS (Rainbow TOS 1.4, BTW) with the floppy A and B icons. But...it won't read any floppy disks.

The cables from the MB seem relatively straightforward; power supply can only be hooked 1 way, and it seems the same way for the ribbon cable as well. The old drive had pin #1 on the far right of the drive (viewing from the rear) and the cable has the dotted red line on that side - I hooked it the same way into the new drive. I wouldn't want to have to flip that cable or anything, its very short.

Any other ideas? Thanks!

Mystery. You did get a disk drive that will read and write the same kind of disks that you did on the now-failed drive. There are DIP switches, and those must be set right, if the old drive worked for a while.

Yes, you got the drive connected OK. The red line is pin 1.

At this point, I would send e-mail to Bradley Koda at Best, explaining the situation, and see what he has to say.

If you can run a soldering iron well enough to move a zero-ohm resistor, and can change a faceplate, I have most of a case of floppy drives, and you can have one for the cost of shipping. KY is too far to walk, and I never want to see "Franklin, y'all" on a water tower again.

If Best does not have a solution, ask again.

If you had not told me the old drive is still recognized, I would have suggested removing and re-installing HDDrive, and installing and removing ICD boot, or Claus Brode's CBHD, or Atari's AHHD. Sometimes that works for a drive that is not recognized after taking a machine apart, although it is a bit of a witch doctor approach.

If you have not turned the machine off for 20 (or 10 or 15 or 5) minutes before trying that drive new drive, do that too. I have a TT, with some things in common with a MegaSTe, and that does away with strange boot errors. The memory does need some time to fully power down.

Jim

There are jumpers on both drives. I haven't touched them though. The old drive worked in this Mega from the time I've had it (1987?) till now. Never had a problem out of it until it stopped reading floppy disks.

> Yes, you got the drive connected OK. The red line is pin 1.
>
> At this point, I would send e-mail to Bradley Koda at Best, explaining the

I did that, Brad says that the 34 pin ribbon cable has to be flipped for some drives. I did this (very tight BTW, ultra short cable) and I think it was the problem why the new drive wasn't powering up at all. It does now power up, spin, access light on, when I boot up. However, its now exhibiting the exact same symptoms as the old drive - in other words, it won't read floppy disks. With this in mind, I'd tend to conclude that my problem has not been the floppy drive but something else all along. I wonder if it could just be a bad cable or the chip that controls the floppy drive?

I tried leaving it off for a couple of hours - but it didn't help. I really don't think thats the problem. I tried the infamous "6 inch drop" fix that Atari techs used to recommend but that didn't help either.

I guess the next thing I'll do is order a new chip and cable. Hopefully that will do it.

Thanks for all your help! :-)

It is probably the WD117-02-02 or Ajax chip (either will do for 1.44 meg disks, Ajax will let you clock the drive with 32 MHz, for a 2.88 meg disk) which will probably not have the courtesy to be socketed.

I have screwed up more things than I will admit pulling chips off of boards without a vacuum soldering station. Best thing short of it is a Dremel tool with a cutoff wheel to cut the pins off the chip. Those can be removed without damaging anything.

And if you break the new chip, I have too many of those, and you can have one for the cost of shipping. Have too big a junk collection.

Jim

Well, I'm gonna take it apart (again! <grin>) and try to figure out what is socketed and what is not. I've got a Mega ST field manual I picked up somewhere, maybe it will help a bit.

Brad seems to agree with the way we are thinking, he mentions 3 chips (and the order he would replace them) in his last e-mail:

WD1772 chip (chip controller)
MF68901 (multifunction)
YM2149 (sound)

He says that depending on when my MB was manufactured, any or all of the above may be either socketed or soldered in.

I can't help you with your request but I do have a question. Can you use a Mega ST/STE/TT keyboard with a Falcon?

Just wondering - I'm recasing a Falcon as well and I'd much rather use a genuine Atari keyboard vs a generic PC type...

Thanks!

Is there any way that a zip disk written on an STe can be read on a PC or vice versa?

TIA

Yes, it should work as is. I have done it since I do own a STe and my wife uses a PC.

Nope, the STe disk isn't recognised on the PC prob because of the different
format needed to be read on the Atari as defined by HDdriver 8.

Thanks anyway.

I don't know if this works on a STe - it surely works on Hades 060 and
TT 030 - just partitionate the disk with the "TOS & Windows combined" option
set to on. This way you can use the zip on STe, pc and even on a Mac.

I'm doing this since many years now.

I tried it but, because I'm not using Magic or Mint, it doesn't work. Any other ideas would be gratefully received.

Hm... Maybe you can give BIGDOS a try. With BIGDOS single TOS will be
able to read DOS partition >32 MB

Or you can make 3 partitions of 32 MB.

I've tried to plug a SCSI zip 100 on the scsi port of my tt030 and it seemed
to work.
Has anybody an experience on working with zips on these computers?
If so it's great since I am able to use cheap removable 100M harddisks!!!

I'm been using an external zip 100 since years now. First on my TT030 and
then on the Hades. No problems whatsoever with that device. However on the
Hades the first internal SCSI Zip drive died only after two years or so.
The replacement Zip drive (brand new) didn't take soo long to die. I
believe one year. Both internal Zip's had the same faulth, the so called
"click of death".
See <URL:http://news.com.com/2100-1001-207628.html?legacy=cnet>
<URL:http://www.lowendmac.com/tech/clickodeath.shtml>

I was lucky I didn't lost any Zip disks.
The old external Zip still works correct and I'm very pleased with it.
It's very handy to make back-ups of the Hades.

If you partionated then with HD-driver using TOS & Windows format you'll
be able to read/write the disks on every computer using whatever OS.

```

I have two SCSI 100 ZIP drives on my TT, and one of them has an ext2
partition on it. I have never had a problem of any kind with either of
them. Very convenient devices.

One of them is an internal ZIP in an old Syquest box. One of them is
external, in its own box.

On the other hand, every Syquest I have ever had died. My fault, I think,
for not removing the disks when I was not using them, and the heads shook
themselves apart.

Somehow, I got the impression that the "click of death" was an operating
system problem that did not affect Atari machines, where the OS tries to
read a wrong address, and the ZIP keeps trying, off the edge of the disk,
and breaks its heads. I also got the impression that this could have been
designed around, if the Iomega people knew it would be a problem.

If the Hades is an Atari machine, I must be wrong. But, if the topic is
TT030, ZIP drives seem to last forever, mostly because they "go to sleep"
if not accessed for a while.

Thank you for the URLs. I will go look.

Jim

As said the external Zip device is very reliable. It has been connected
to the TT for some time and now it's hanging on the Hades for almost 6
years now. No problem whatsoever. That device has been traveled around
Belgium and went a few times to England (hello Paul).

Alas I can't say that of the internal Zip device I've used on the Hades.
The last one is still inside the Hades and connected but I don't use it
anymore.
Hm, I just tried that internal device and it seems to work again.

You can be right. AFAIR the symptoms were nasty clicks which lasted some
time and sometimes it happened I couldn't access the disk anymore. As
the internal Zip didn't work reliable anymore I bought a new one which
started getting the same problem one year later. In fact both devices
were still working but not reliable ...
Sofar I never has heard such clicks on the external device.

>If the Hades is an Atari machine, I must be wrong. But, if the topic is

I guess I must have had bad luck to run into two faulty devices. On the
Mac G3 I've an internal Zip 100 drive which is after all these years
still in good shape.

All by all the Zip is a very good thing to have on the TT030 and if the

disks are partionated the right way they can be used on pc's (or Mac's)
too.

Hi;

Did someone use a Teac FD-235HF 6291-U floppy drive for Atari (the 6291-U suffix is important, other variants have different jumpers/pads). I can not configure it to output "HD-detect" on pin 2 ot the Shugart connector. Or, is it one of those Teac drives which do not ever output a HD-detect signal?

Beside the DS0/DS1 jumper, on the drive there are about six pair of solder pads, but without any information on what they represent.

Thanx in advance.

I do not see why it would not work. I have a Hades060 and it has
the same TOS as a TT030. I have a 1 gig SCSI Jaz drive and it
works great.

Hi There

I've had 2 ZIP 100 chained to my MegaSTe along with a 2 x 4.5 Gig drives, a DAT streamer and CD-ROM.

I can then transfer stuff between platforms using 3 methods!

I've had various sorts of FDDs and they all vary on what they give on
pin 2, some don't give anything. See if the pin is connected, follow
the trace back on the board.

And, there is the possibility that the HD-detect signal is not a nice
useable 5 volt signal, but a little tiny 0.2 volt signal. It is there, but
needs a single transistor, and probably a single resistor, to amplify it
enough to use. It is a nice solid signal, but not very big.

You may need to look carefully to see the amount of signal you get, but on
a Teac FD-235HF 7921-U5, that is what you get. I may have misplaced a

decimal point, but 5v it is not. And, on this particular model drive, it
is not easy to trace the signal back. At the very least, it would take
some serious disassembly.

Jim

Hi, and thank you for your reply.
I still need a little help:
I found a maxtor drive (atkas 10k III) that<suits my needs, but the vendor can't help me with the Bus thing: he just doesn't know what am I talking about. The only thing he told me is that this drive comes in two flavours: with the 'lots of pins' connector, and the 'less pins' connector (I can't remember the number right now, but I think 80 and 68) :-)

Any advice?

thanks

Hello Coda,

That sig is all my computer stuff. My list of Atari gaming
epuipment is as follows: 3 Atari Jags, 3 Atari Lynx's, Atari 400,
two XL's, two XE's plus tons of games for each. I also use my
Hades for some games, but my 8-bit computers are my main gaming
equipment eventhough I know they are good for other things.

UW SCSI drives should work fine on narrow SCSI (ie 50-pin), you just
have to buy an adapter - male 68pin to male-50pin. I have Seagate 4.3GB
68PIN in my TT and it just works fine - the advantage of these new
drives is that they usually run much quieter than the older ones usually
found as a standard for Atari machines :-)

Is there any relationship between the SCSI BUS WIDTH and the SCSI CONNECTOR
WIDTH? This puzzles me since my vendor still can't get the point :-(
Thanks, guys.
Paolo

Yes there is. Wide SCSI uses usually 68 pin connector and cables
(sometimes it is 80 pin SCA, but it is rather rare). Narrow SCSI (as
found in Falcon, TT and Mega STE) is in physically wider than wide SCSI,
but it has 50-pin connectors and cables. And you can connect different
types of SCSI devices in both directions - compatibility should be
retained - you just have to use apropriate adapter.

I have an infrared sender/receiver, which came with the PSI S/PDIF interface for the Falcon.
I guess it'd be possible to write some C code, which uses it to send/transfer files from/to my
Windows laptop, which has an infrared port. And I guess I'd have to use the IrDA standard
to achieve that, right?

How difficult would it be to do an IrDA (or anything else) port to the Falcon and to get it to work?
Has it already been done perhaps?

M

I guess the laptop uses tcp/ip over irda so you would have to write a
driver that connects to the tcp/ip stack you use.

Check out http://home.arcor.de/thomas.redelberger/prj/atari/etherne/ for
some ideas how to make STinG drivers.

(Hm, just noticed the EtherNEC driver got updated on 17/4-2004 with "IP broadcast support". Have to check that out right away as I have problems with my subnets hee...)

I'm using STinG on the Atari to connect to a WinCE handheld via serial cable. Some irda dongles with serial connectors act like a standard nullmodem cable and should be possible on the Atari. Others communicate at a lower level (with standard 9 pol dsub connector) and need special drivers.

>How difficult would it be to do an IrDA (or anything else) port to the Falcon >and to get it to work?
>Has it already been done perhaps?

I would first setup both the laptop and Atari to connect via nullmodem cable. When that works its time to try irda...

Another cool thing would be to write some code for the IR receiver, which
controls FalcAMP or similar software, using an ordinary TV remote control :-)

Then I could use the Falcon for *something* useful at least :-)

Or write a piece of code, which lets you point an ordinary remote control
towards it and given a certain key sequence, e.g. 999, then it checks
your mailbox and play s a sample stating if you've got email or/and how
many etc.

There are a few interesting uses for that infrared sender/receiver...

handy with a soldering iron?, they're easy to make , , , just make sure its
a decent cable, shielded like the genuine Atari cable.

I don't know what country you are in, but where I am, I can travel within 5Km's/3miles from my doorstep to get everything I need. including Atari monitor plugs and sockets, since they are commonly used on a brand of hi-end audio gear, which I cant remember..

You can't build a DMA cable using monitor DIN connectors :-)

Are these 19 pin d-sub connectors used for anything but Atari DMA cables?
I have never seen them in electronic component catalogues. Are the
produced at all?

absolutely. If you want ill buy them and sell them to you for $50 each if
you believe you cant get them :)

Eh!, a monitor plug is no good for a DMA lead, you need a 19 pin D
connector.

Good! I have kept an eye open for such connectors without finding any
locally. I was one DMA cable short for a couple of years but actually
found one some time ago.

Thanks Edward,

I noticed you are always helpful.

I guess I should live in some far away planet, where any Radio Shack has Atari cables. But unfortunately on Earth they are hard to come by.

I tried Best Electronics before posting but could not locate one in thier online catalog. I saw one on Ebay last week but I missed the auction. Maybe I have to email Best.

I just figured maybe one of you Atari gods would have a spare one for 10 bucks or so. Sheesh

Hello,

Does VDI talk straight to the hardware, or work through BIOS /XBIOS? Is the Line A interface considered part of VDI? Am I right in thinking that AES draws everything using VDI calls?

Hello,

KM> I guess the laptop uses tcp/ip over irda so you would
> have to write a driver that connects to the tcp/ip
> stack you use.

I've seen quite a few laptops that only support serial over IrDA (probably up to 115.2 kbits/sec) and I imagine the ones capable of faster rates may be backward-compatible with that too. If you got serial over IrDA working, there's a good chance that you could run PPP over that (which is I think what people do when they connect...

laptop -> cellphone -> Internet

...with the laptop -> cellphone link being IrDA.
Tommy Bohlin wrote an open-source IrDA implementation. Even if it can't be ported directly, it may include important clues as to how this might be made to work.

Hello Sam,

SF> Those of you who use your Atari's (not counting the Atari
> clones, sorry) for web surfing. What modems are you using, and
> which isp's are you using? The reason I'm asking is because most
> of them seem to have some software that needs to be installed,
> but is not made for Atari systems.

Why exclude clone users? They're probably in the same boat so far as
this question's concerned. I've not tried this on Atari, but (for
their sins) Earthlink offer true PPP dial-up and gave me all the info
that I needed over the phone when I first ordered service.

Hope this helps,
- Andy Ball.

Hi!!!

do this

Download Deskpic5.tos from the link.

ftp://ftp.lip6.fr/pub/atari/Graphics/deskpic5.tos

Create an folder called deskpic on any drive, copy the deskpic5.tos to
this folder and unpack it, duobbleclick on it and it will unpack it
self, it's a selfuppacking LZH archive.

it will appear a folder namned Deskpic, open it, there will you find 2
folders, namned Auto and Pics, open the Auto folder and copy Deskpic.prg
to C:\Auto, then copy the the folder pics to C:\ and the Deskpic.inf to
C:\ at last copy Deskpic.acc to C:\, then reboot your Atari.

After that open the Deskpic from the ACC menu, click with the mouse in
the radiobutton namned "an", the program will say no pic is loaded,
ignore that and click OK. Then click in the square namned "laden", you
will get the ordinary fileselector, find the folder C:\Pics and choose a
pic, for example paper.gif, yes this program support GIF images. Then
okej, the pic will appear on the Desktop, click on the bigger button
namned "Sichern" then the button "Ausgang"

Enjoy and have fun Atari runnin.

Regards

M.Lj aka MrAtari

Where are you? I have a Genuine Atari Male to male cable from an old
megafile spare. Let me know, how you go.

Mark

I have a SC1224 (Samsung) that has siezed up / frozen Brightness and Contrast knobs. But the volume is fine! Weird. This seems to be quite common on this samsung brand. Another one had all 3 frozen, and another user told me his does the same thing. What is the best way to loosen up the knobs? I don't want to force it and have them break, as the monitor seems to be working fine otherwise.

personally, id open it up and replace them, I've done it to a friends commodore monitor a few years ago and had no trouble finding replacement pots. worst case you may not find ones that fit where the old ones are and may have to drill holes in the case to install them elsewhere and install generic knobs on them.

I have four dead motherboards from my two TTM195 monitors. They do not
seem to last forever. I also have more dead flyback transformers than dead
motherboards, and finally think I know what the problem is. Replacing the
flyback only kills one more flyback transformer.

Those flyback transformers have unused windings, and a whole bunch of
parts dedicated to properly damping those windings. When I have found
something else failed, it was in that area, but I have never found all the
failures.

If I ever do this again, I will first replace each and every part involved
in damping unused windings. This will now be harder, since the two parts
places in my home town have just quit the business. But it would be

faster, and cheaper than yet another motherboard.

It seems that if one, and only one, of those winding damper parts quit,
the winding will ring, generate high internal voltages, and punch through
whatever insulates the main winding, which shorts out.

There are no other postings today, so now there is one.

I just went to a ITC Electronics in Chatworth,CA and they have the 19 pin male, female and hoods. The male was $1.25, female was $1.10, hood was $.75 . The prices were really close to what I have posted. They do not have them listed on line but they do have them in the store.

http://www.itcelectronics.com

You can contact the Chatworth store at the bottom of the ITC page.

TRY THIS!! IT WORKS!! MONEY $$$ NOW!I COULD NOT BELIEVE IT!! I ACTUALLY RECEIVED MONEY! Here are the 3 easy steps to success: STEP ONE: Get 6 separate piece of paper and write your name and address plus the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 12 US$ and place TWO inside EACH of the 6 pieces of paper so the $2.00 will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the envelopes and seal them. You would now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and $2.00. What you are doing is creating a service and you are paying for it! Like most of us I was skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office 1-800-725-2161 and they confirmed that it was indeed legal. Mail the 6 envelopes to the following adresses: 1. MANUEL TINAJERO/542 HERNANDEZ/ LAREDO/TEXAS/ 78046/ U.S.A 2. R.C FAULK/ 7509 NE VAN MALL DR. C-13/ VANCOUVER/ WASHINGTON/ 98662/ U.S.A 3. ZACK LONGLEY/7686 CALLAGHAN RD. APPT 3304/SAN ANTONIO/ TEXAS/78229/U.S.A. 4. MAURICIO LIMA/ 4221 AGUSTIN MUNOZ MONTEVIDEO/11900/URUGUAY 5. E. SIMON/ 1849 SEDGWICK AVE/ BRONX/ NY/10453/ U.S.A   6. B. CURRY/ 14923 JERPOINT/ ABBY DR./ CHARLOTTE/ NORTH CAROLINA/28273 STEP TWO: Now take the #1 name off the list that you see above, move the other names up 6 becomes 5, 5 becomes 4, etc., and Add YOUR NAME as number 6 on the list. STEP THREE: Change anything you need to, but try to keep this article as close to the original as possible. Now, post this amended article to at least 100 newsgroups. (There are close to 450,000 groups on Yahoo Groups alone). All you need is 100, but remember, the more you post, the more money YOU make! You won't get very much unless you post like crazy! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Internatational Postal Lottery Act. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keeps the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 dollar bills in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and directions carefully followed, six members will be reimbursed for their participation as a List Developer with two dollars each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving tens of thousands of dollars in CASH!!! What an opportunity for only $12.00 ($2.00 for each of the six listed above) Send it now, add your name to the list and your`re in business! NOTE: Send only US dollars in this program as the US dollar always has a stable exchange rate and is easily available to peoples outside the U.S. If you live outside the U.S. then please exchange local currency int 12 US$. Exchanging money int $

is cheap, easy and can be done at most banks, post offices, embassies even
super markets. It will all be worth it when you start receiving thousands of
dollars in the mail. Also letters to places other than your own country, it
is a good idea to send them airmail not by land, there is not a lot of
difference in price for this. POSTING TO NEWSGROUPS***************** STEP
ONE: You do not need to type this entire letter to do your own posting.
Simply put your cursor at the beginning of this letter, drag your cursor to
the bottom of this document, and select `copy` from the edit menu. Open a
blank `notepad fill

> taking a similar chance with $5 of my own bucks. Not a big chance, I
> admit--but one with incredible potential, because $5 is all anyone ever
> invests in this system. Period. That's all Mike, Dave, or Lars invested,
yet
> their $5 netted them tens of thousands of dollars each, in a safe, legal,
> completely legitimate way. Here's how it works in 3 easy steps:
>
> STEP 1. Invest your $5 by writing your name and address on five seperate
> pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING

LIST."
> (In this way, you're not just sending a dollar to someone; you're paying
for
> a legitimate service.) Fold a $1 bill inside each paper, and mail them by
> standard U. S. Mail to the following five addresses:
>
>   1-Bill Sahota
>   St. Olofsgatan 20, 1tr.
>   S-753 11 Uppsala
>   Sweden
>
>   2-Tiit Raag
>   Vilja 18b-11
>   EE2710 Voru
>   Estonia
>
> 3- Eric Garro
>   P.O. Box: 32-2400
>   Desamparados, San Jose,
>   Costa Rica
>
> 4-Rub�n Pagura
>   Ap. 461 - 2050 San Pedro
>   San Jose - Costa Rica
>
> 5-Jessica Hitchan
>   20280 N. 59th Ave. Ste 115-#310
>   Glendale, AZ 85308
>
> STEP 2. Now remove the top name from the list, and move the other names
> up.This way, #5 becomes #4 and so on. Put your name in as the fifth one on
> the list.
>
> STEP 3. Post the article to at least 250 newsgroups. There are at least
> 9000 newsgroups at any given moment in time. Try posting to as many
> newsgroups as you can. Remember the more groups you post to, the more
people
> will see your article and send you cash!
>
> STEP 4. You are now in business for yourself, and should start seeing
> returns within 7 to 14 days!
>
> Remember, the Internet is new and huge. There is no way you can lose. Now
> here is how and why this system works: Out of every block of 250 posts you
> make, you wil get back 5 responses. Yes, thats right,only 5. You make
$5.00
> in cash, not checks or money orders, but real cash with your name at #5.
> Each additional person who sent you $1.00 now also makes 250 additional
> postings with your name at #4, 1000 postings. On average then, 50 people
> will send you $1.00 with your name at #4,....$50.00 in your pocket! Now
> these 50 new people will make 250 postings each with your name at #3 or
> 10,000 postings. Average return, 500 people= $500. They make 250 postings
> each with your name at #2= 100,000 postings=5000 returns at $1.00

> each=$5,000.00 in cash! Finally, 5,000 people make 250 postings each with
> your name at #1 and you get a return of $60,000 before your name drops off
> the list. And that's only if everyone down the line makes only 250
postings
> each! Your total income for this one cycle is $55,000. From time to time
> when you see your name is no longer on the list, you take the latest
posting
> you can find and start all over gain. The end result depends on you. You
> must follow through and repost this article everywhere you can think of.
The
> more postings you make, the more cash ends up in your mailbox. It's too
easy
> and too cheap to pass up!!! So thats it. Pretty simple sounding stuff,
huh?
> But believe me, it works. There are millions of people surfing the net
every
> day, all day, all over the world. And 100,000 new people get on the net
> every day. You know that, you've seen the stories in the paper. So, my
> friend, read and follow the simple instructions and play fair. Thats the
> key, and thats all there is to it. Print this out right now so you can
refer
> back to this article easily. Try to keep an eye on all the postings you
made
> to make sure everyone is playing fairly. You know where your name should
be.
> If you're really not sure or still think this can't be for real, then
don't
> do it. But please print this article and pass it along to someone you know
> who really needs the bucks, and see what happens. REMEMBER....HONESTY IS
THE
> BEST POLICY.YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS! GOOD
> LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL WIN AND MAKE SOME REAL
> INSTANT FREE CASH! *** By the way, if you try to deceive people by posting
> the messages with your name in the list and not sending the bucks to the
> people already included, you will not get much. I read someone who did
this
> and only got about $150 (and that's after two months). Then he sent the 5
> bills, people added him to their lists, and in 4-5 weeks he had over
> $10,000! TRY IT AND YOU'LL BE HAPPY!! GOOD LUCK TO YOU ALL!!
>
> HOW TO DO THIS: If you have Netscape 3.0 do EXACTLY the following:
>
> A) Click on any newsgroup, as you were going to look at it. Then click on
TO
> NEWS which is on the far left when you're in the newsgroup page. This will
> bring up a box to type a message.
>
> B) Leave the newsgroup box like it is. Change the subject box to something
> like �Fast Cash� or �Need cash?- Read here�.
>
> C) Tab once and you should be ready to type. Now retype (only once) this
> entire article word for word, except to insert your name at #5 and to
remove

> #1 of the list, plus any other small changes you think you need to make.
> Keep almost all of it the same however!
>
> D) When you are finished typing, click on FILE in this box (just above the
> send button... not where it says Netscape News on the first box. Now click
> on SAVE AS in the dropdown menu. Save your article as a text file in your
C:
> or A: drive.
>
> E) If you still have all of your text, send or post to this newsgroup now
by
> just cliking the SEND button (just below the File dropdown menu and above
> the Cc: button.
>
> F) Here's where you are going to post to 250 ore more, newsgroups... OK...
> click on any newsgroup then click on "TO NEWS"... again. In the top left
> corner of your screen. Leave the newsgroups box alone again, put a flashy
> subject title, hit tab once and your in the body of the message. Now,
click
> on the attachment file... now find the file that you just saved in the
> previous procedure. Click ONCE on the file and click OPEN and then OK. If
> you did this correctly, you should now see your file name in the
Attachments
> Box and it will be highlighted.
>
> G) That's it!!! Each time you do this, all you have to do is type a
> different newsgroup so you can post this message to 250 or more DIFFERENT
> NEWSGROUPS. I know, I know, you still have 249 to go, but it only takes
> about 30 seconds each, once you get the hang of it.
>
> Here it's a Write 3.0 format file [usenet.wri] with at least 1,600
> newsgroups addresses:
>

Hello

I just bought a Mega ST4 on Ebay but it doesn't have a keyboard.
At the time I saw a Mega Ste TT Keyboard but I didn't know
whether it would work for a plain Mega.

B&C wants $130 for a Mega keyboard.!

Bud

They did come with different keyboards originally, but both use the same connector and work. So the MegaST1/2/4, MegaSTe and TT030 all use the same keyboard connector.

It will work as long as it is set to DS0, and NOT DS1 as most WC
compatibles require. How you set this depends on the drive.

Hello All,

I'm in the U.S.A. in Virginia. Anyone know of where to find used external scsi cd drives?

My web searches aren't pulling up much.

Thanks
Sam F.

Has anybody got the pinouts for the STM power supply. I picked one up
and need to build a PSU for it. Ah, vintage stuff. This addiction will
kill me(more likely the wife will;-).

Thanks again

Mark Bedingfield

The easiest way to convince the wives, is to make an addiction for them...
I make my wife addict to Vintage Barbies Collection .. xD

Yes, you can use a HD disk in a ST, but you have to cover up the
hole on the upper left of the disk first.

I would try Ebay, Best Electronics or B&C Computers. Or just get
an external CD case. I have seen them for sale from time to time.

1.44m drives are OK, after all, they were designed to be backward compatible
with the 720k ones.

But remember that 1.44m diskettes are not reliables when used that way. The
magnetic fields of a 720k drive are not intense enough to imprint correctly the
coating of 1.44m disks.
Good night!

I have a Daynaport SCSI link T attached to my falcon. I am trying to network the falcon to my home network which consist of 3 PCs. I have installed HDDriver 8.1 and it recognizes the daynaport as scsi ID 1.3. But when sting runs and loads the scsilink.stx (daynaport scsi driver) I am suppose to see a message "SCSILINK.STX: Ethernet0 on bus/id 1.3". But the message I get is "No
SCSI device found". In my auto folder I have Sting.prg and Sting.INF. In the root of drive C I have zcontrol.acc and I have stngprot.cpx and stngport.cpx.

When I open zcontrol and double click on sting port setup I get 2 bombs and the falcon locks up.

Thanks to all in advance for any tips or suggestions.

Claude Bourgoin

Does anyone know what this error means ?

Illegal AES Function Call
Opcode: 224

It happens when I run Imagecopy from a FreeMint NewFatFS
partition. With the original ROM TOS FS Imagecopy works fine.

Alternatively is there a decent replacement for Imagecopy ?
Something that can display various file formats, zoom, rotate,
print, slideshow, convert etc. ? I've tried a few but none
has worked so well as Imagecopy.

Regards,

Peter

> I just purchased Atari 520STfm and never had any experience with Atari
computers before. When I turn it on, a row of black cherry boms appears
across the white screen and refuses to go away. Resetting doesnt make any
difference. Is it normal? Does anyone know how to get rid of it? Is there
some Key combination to reset/reboot the system?
>

No this is not normal. Do the univeral Atari Drop Fix! ;) Lift computer 4
inches off a hard surface and drop! Though the better long term fix would
be as already mentioned, open it up and press on all socketed chips. Should
do the trick. I have a 520STm also that does the same thing and I have to
drop it once in a while as I am lazy. ;)

Tim

PS> Illegal AES Function Call
PS> Opcode: 224

It means that the program try to use a AES function with the number 224. The AES (Application Environment Services) is a part from TOS.
There is no function with this Opcode in the TOS or any operatimg system for the Atari.

Message-ID: <20040210120356.27149.00001725@mb-m11.aol.com>
Xref: archiver1.google.com comp.sys.atari.st.tech:5495

Hello All,

It's me again. Another question for you all to think about: I have a C-Lab Falcon/Magic and an athlon/winxp system. I access the web with the pc. I'm thinking of networking my Falcon to the pc, open a web connection with the pc, and then I should (all things considered) be able to launch Highwire and browse my favorite websites.

Now, what I'd like to know is: how can I do this. Keep in mind that this is a C-Lab Falcon, and C-Lab may have messed around with the external scsi port and yacked it up. I say this because I've been having the darnedest time trying to get either of my cd drives recognized and not crashing my boot partition.

I've got Sting and Magicnet. I've got a Farallon unit with a localtalk connector on one end and on the other end a bnc connector and an rj45 connector.

There you have it. I'm ready to listen to all ideas.

Thanks
Sam F.

One advice would be to stop your double posts to comp.sys.atari.st and
here. I you post something that is relevant to both these groups use
crossposts instead.

Why? Cross posting means that _the same_ post goes to more than one
newsgroup. Clever newsprograms will mark the message as read in all
groups as soon as it is read in any group.

As a rule crossposts should be avoided if not really useful.

I remember getting the same message after i compiled an application that i
was coding with Pure C. It was also in a FreeMiNT enviroment. I think i
solved the problem chaging the order of the lib files in the project file or
changing some compiler options. It was very extrange because the opcode that
i got didn`t belong to any AES function.

Whatever it was i think i can't help you. :-)

Hello All,

Can't really make up my mind. Now considering installing Mint. What are the advantages (if any) of a Mint setup over a Magic 6.x setup? And what does a typically basic Mint setup consist of? And would I still be able to run the software I'm currently under Magic, I.E. Atariworks, Pagestream, Aniplayer, etc.?

Thanks

Hmm. Since this doesn't happen when using the ROM TOS, I wonder
where this call is coming from. It can't be from Imagecopy otherwise
it would happen with TOS FS. It doesn't make any sense for NewFatFS
to make this call.

Is it a bug in NAES ? I suppose I could try using Xaaes again to see
if it still happens.

Regards,
Peter

I don't think it's a bug in N_AES or NewFAT. It's more likely a
shortcoming of Imagecopy. Anyway Imagecopy (IC 4.2b2 plus) does work rather
well with my setup. IC works even on an ext2fs partition. It can't
handle very long filenames however.

HTH,

Martin

Hi Everybody!!

Specifically what fonts can I use with Atariworks, NVDI4?

Thanks,

Sam F.

Truetype fonts are all you need. Speedo fonts too from memory.

Boxkite reports that this app may not be able to handle LFN's when choosing this option and it's almost right :-(

Imagecopy seems to work better if you drag and drop files onto it rather than load them in from its menu.

Filenames up to 14+3 seems to work. With longer names I get an address

error or sometimes a bus error.
>

Drag and drop does work better as long as the picture isn't located on
an ext2fs. With this FS Imagecopy says "file not found" when one drag
and drop a file onto it.

Hi,

You seem very insistant about getting a desktopper case! I have one Falcon
recased in a Desktopper and it is really good, loads of room for expansion
etc.
But...... I have not found anywhere selling these kits. I wouldn't mind one
for
my Falcon that I plan to plant a CT60 in, but no-one seems to sell one.

The Falcon I have that already has a desktopper has an AB040 in it, so I
don't
really want to play with that one! (too many dodgy mods on it!!)

If you find somewhere to get a desktopper, or the tower case solution they
advertised let me know 'cos I'd like one!

Many thanks,

Richard.

If I can find one for my Falcon, I'll be the only one getting it! :)

What tower case are you referring to?

I would attempt to re-case my Falcon in a PC's tower case, but it just seems to
be so trouble.  What with all the cutting and trimming, and drilling, and cable
extensions, psu modificiations etc.

If Wizztronics rack case wasn't so blasted expensive (after you add what you
need), and no one even carrys the cpu for it anymore.

Same to you, if you find someone somehwere who carrys a few desktopper, please
let me know, and I will do the same.

Thanks,
Sam F.

Hi All,
maybe I'm OT, but I need some info about ajax chip..
I'm building a floppy interface for a Z80 based mini computer and I have got two chips, one is the wdc original 1772, the other is an atari C302096 (ajax chip). I'm using old 720K floppy drives, so 1772 is clocked at 8MHz. While with original 1772 everything works fine, when I put the ajax chip I'm not able to read the floppy...seems to be a problem with the head steps, but I'm not sure..
Does anybody knows any differences between the chips other than max clock frequency?

Thanks in advance..

Hello All,

Anyone no where to get a C-Lab MarkX case? I've thought of getting a Wizztronics rack case, but geez, by the time you add everything that you need, it's between 300-400 dollars for the darn thing! Certainly there must be a less expensive yet equally viable solution?

Thanks

Hello All,

Another inquiry for a case for my Falcon. Does anyone know where to get an Eiffel Space Case?

Thanks,
Sam F.

Hey Don,

I've checked a couple of timesm but I've not seen it. Is there a specific url? I've been using www.ebay.com/de. Of course, when I type in the search box Desk Topper, nothing comes up.

Thanks

You could try searching for Space Case, though it looks like its been resprayed.

You can get brand new Space Case kits from www.atari-workshop.co.uk which include the FreeKeys keyboard kit for �149 (look under the Special Offers page)

I have one for one of my Falcons and it is pretty good, but because of the lip on
the top of the case you cannot fit a 5 1/4" drive in the second level. But it is nice
to have the floppy drive at the front of the machine.

Hope that helps,

Richard.

Hello,

I've heard that when looking for a scsi cdrw drive, I need to make sure that it
is scsi-3/mmc compliant and/or was manufactured after 1999.  Question:  where
do I look for/find this info?  In particular, the MMC-3 compliance?

Thanks

Hi all,

The Stacy ROM chip holders have enough pins to carry two 1 Mbit TOS 2.06 ROMs. Is this possible to run TOS 2.06 on a STacy without having to set jumpers or modify stuff?

Cheers,
Martijn

Appearently there's an extra MIDI port expansion that uses the Atari ST's RS232 port to give you another 16 MIDI channels. CueBase V2 supports this expansion port.

Later versions of Master Tracks Pro also used a MIDI port expansion on the RS232 to give an additional 16 MIDI channels. Does anyone know if the exanders are the one in the same? Also, are the schematics for this expander available online anywhere?

I'm also curious as to how well the Atari's RS232 port works as a MIDI port since it's top speed is only half that of a MIDI interface. Is there much lag?

> available online anywhere?

Maybe, maybe not. I'm not sure if there was an agreed standard for converting RS232 lines to MIDI or not. Some serial MIDI interfaces have as many as 4 outputs + 2 inputs.

C-Lab - Emagic had a 3 output device called Export

Steinberg had several I think...most notably the SMP24, 2in, 4out plus SMPTE and lots of controler and patching abilities, and some small grey thing (dunno what it's called, but I have one) that has 3 outputs and one input.

Dr. T. had a single thing on a cable that offered one extra output.

MO4 is 4 outputs...I think it can work from serial or parallel port...had drivers for MROS, and I think was compatable with Creator, Notator, and LogiC.

I think Hybrid Arts had a few variations out as well.

There have been slews of others over the years.

> I'm also curious as to how well the Atari's RS232 port works as a MIDI port
> since it's top speed is only half that of a MIDI interface. Is there much

There's plenty of bandwidth for this amount of MIDI channels!

I've never had any problems with my SMP24, nor that Steinberg grey box thinggy.
No lag...

For hudge sys-ex dumps...while unlikely, you might find some device that trys to hog bandwidth and mucks up the works; however...ya still got the built in ports...and well...alot of librarians and such can only see that default port anyways, and, as a general rule of thumb you wouldn't do any massive sysex dumps while music is playing anyway.

There are also a few devices that hook to the cartridge port.
Some of these might not work in Falcons....all should be fine with ST and TT.

Midex and Midex+ SMPTE SYNC(M_ROS-Steinberg Only)
Unitor II SEMPTE SYNC(Creator, Notator, Logic, M_ROS [Steinberg])

No No No, all parallel/printer port!

> MO4 is 4 outputs...I think it can work from serial or parallel port...had
> drivers for MROS, and I think was compatable with Creator, Notator, and
LogiC.

No No No 2. Parallel only,Cubase (?) only!

> > I'm also curious as to how well the Atari's RS232 port works as a MIDI
port
> > since it's top speed is only half that of a MIDI interface. Is there
much

> There's plenty of bandwidth for this amount of MIDI channels!

B******s, A few midichannels at most, push the serial port and it chokes,
bigtime!

> I've never had any problems with my SMP24, nor that Steinberg grey box
thinggy.

Not surprising, see above......
>
> For huge sys-ex dumps...

I wouldn't advise sending sysex anywhere near the SERIAL port, others may
disagree.

> anyways, and, as a general rule of thumb you wouldn't do any massive sysex
dumps
> while music is playing.

Well you got that bit correct!
>
> There are also a few devices that hook to the cartridge port.
> Some of these might not work in Falcons....all should be fine with ST and
TT.
>

> Midex and Midex+ SMPTE SYNC(M_ROS-Steinberg Only)

Cubase only.

> Unitor II SEMPTE SYNC(Creator, Notator, Logic, M_ROS [Steinberg])
> Log 3 (Logic)

Best kept to C-Lab/Emagic, 'tho' the Unitors will work as midi expanders
with Cubase.

I'd like to tie may falcon to an ethernet network (microsoft client).
Is it possible ? How to do it ?

Thanks

Philippe

Hmmm??? I am not sure if that is true. I know what I bought mine

(and I have two), I did not even think about the year they were
made.

Yep. Use an ethernec adapter (http://hardware.atari.org) to connect it to the ethernet. As for Microsoft networking, you'll need Samba. I'm not sure if Magicnet or STiK/STiNG support that, but MiNTnet does.

Maurits.

> B&C wants $130 for a Mega keyboard.!

I know it's a lot for a keyboard. Do consider this however.
If you've ever seen the guts of a Mega ST keyboard, you'll see it's not cheap!
They don't make them like that anymore. It's a good feeling, heavy weight
keyboard with tactical switches for each single key. Individual key switches
can be replaced if they go bad by 3 or 4 simple solder points. It will last for
decades! Every time I think my mega keyboard is dead, I find that a good
cleaning brings it back to brand-new like life.

Brian

Hi all !!!

I explain you the problem: Wanting to start again my 260 ST, I had the unpleasant one surprised to have a screen with multicoloured vertical lines then a whole of multicoloured points!

With each time I starts again it I have same Pb exactly! I dismounted the monster : a rapid overflight shows me that a condenser isn't well at one end the face is completely black with a hole! (470 mF, 16v)

I put links to you towards the photographs of what I have (it is easier to have an idea)!
Two screens:
http://lacantina.dyndns.org/sasfepu/images/260st/260st_ecran1.jpg
http://lacantina.dyndns.org/sasfepu/images/260st/260st_ecran2.jpg

The condenser :
http://lacantina.dyndns.org/sasfepu/images/260st/260st_in.jpg

It would be great someone could say to me if it is repairable or if it definitively died!!!!!!!!!!

Thanks in advance !!!

Michel

If the ST hasn't been used for a while, you might want to remove and reinstall the socketed chips before you do any more repairs. The symptoms you describe might indicate some bad connections to the shifter or GLUE-chip.

Might be - but it might also be some kind of rubber seal with a hole for the
overpressure vent, so it may be perfectly well.

Check the power supply if you really have 5V - best with an oscilloscope.

cu

And the MMU chip too.

But before reinstalling the chip you have to move a bit all the pins (to
external of the chip) to get a better contact againt the pins of the
sockets.
And use a special electronic contacts liquid...
I did that so many times to repair ST in the old time...

Hi !

I've checked the power supply with a digital voltmeter (I've no
oscilloscope) and I've 5 v (5 to 5.2 v) !

Thanks for your help !!

Michel

have you checked the voltage accross that capacitor ? normally you get vertical black and white bars if you loose a address or data line somewhere, colours indicate a something more problematic such as loss of power to the ram section. Normally the power goes via a small inductor, it could be dry...

Chris

I've an old Mega ST4 here.
It has TOS 2.06 (Wiztronics TOS board) and Xtra RAM 8 installed.
Hard Drive via Link 97 and HDDriver8.

Without the Xtra-RAM enabled.
Blitter off.
No auto-folder apps.
No desk top accessaries.

Any version of Notator I run here and I get midi overflow and garbled MIDI
output. A sequence will only play a few seconds all garbled sounding and stop.
The screen doesn't update till it stops itself.

This also happens over Unitor2 with two different dongles.

Also happens if I switch back to Rainbow TOS and pull out the Xtra-RAM board.

It had worked just fine before....with same hardware config.
She same copy of software/sequence-files and dongles work fine on my STacy.
It's A new delima.
The mega also seems to work fine with other sequencers...CuBase2, CuBase Audio
Falcon,
Master Tracks Pro, KCS, MIDI Spy, etc...

I thought it might be that 200mhz clock that's so popular, but other software
that claims to use it does just fine.

Any ideas? Do I have a bad hardware timer or something? If so, what next?

Thanks,
Brian

Most Electrolytic capacitors (condensers) have one metal (negative) end which is part of the can and a black plactic (positive) end cap that is held in place due to the the top end of the can being folded over it. Ususally when a capacitor like this blows the end cap blows off and a cotton wool type substance is ejected usually accompanied by some silver foil.
Unfortunately I am unable to view the image of it at this time but it does not sound like this has happened, however they can become short circuit as well which could cause problems. The way to check this is to remove one end of the capacitor from the circuit and measure its resistance, if it is not short circuit the reading will increase (if you have your meter probes connected the right way round) and should decrease when you reverse the probe connections.

I'm not expert but it sounds like it could be a problem with the video shifter, make sure it is in its socket correctly and check any electrolytic capacitors that my be close to it.

General Note:
The electrolite in electrolytic capacitors will dry out resulting in the capacitors going short circuit if the equipment is not used for a long time. If you have equipment that has not been used for a long time (5 years +) the best thing to do is to connect it via a variac set to provide 50V AC output and leave it on for a day so that the electrolytics get trickle charged which can reform the electrolite as

opposed to turning them at full load.
I appreciate that not everyone has this facility therefore you should
disconnect the output from the main power supply (which has the most
susseptable capacitors) from the circuit board and leave it on for a
day. I recommend keeping an eye on it in case something start to burn
so you could do just an hour or two over several days.

Then you probably (though not sure) have no power supply problem - most
likely is bad contacts at any of the socketed chips. Try cleaning the J pins
on the square PLCC chips with a glass-fiber eraser (used for retouching
"indian ink" technical drawings)

cu

Hi!

I have not much experience with the technical part of atari ST machines. But I hav lots of experience with the repair and maintenance of atari 8bit computers. It looks like your atari does not reach the OS. The colour bars are the first thing the atari shows in les then a second before the screen turns white and then a disk-boot and desktop comes up.

In your case the white screen does not come ... so there must be a halt somewhere. I think it is the OS_ROM (does an atari 260 st have OS in rom btw.?) or in other case I think it is a fault in your ram-section.

By the way the capacitor in the corner is a piece that takes care of in-disturbance, so I guess even if it is defect, the problem is not what you have now..

Marius

Is it worth risking an eye or a fire for something that costs pennies to
replace??.

If it had worked fine before check sound modules' and trigger midi "daisy chain"
loop configuration for thru switches and possible midi shorts. Notaor's own thru, virtual on the st, has caused
this sort of behaviour in modules and vice versa . If trigger is also a sound
module or sequencer-type workstation it can overflow out itself or the sequencer with mismatched thru settings.

Hi All       I am in the process of purchasing a Jam Pro 2 in/8 out
converter box to get audio into/out of my Falcon.
                I notice from pictures the vendor has sent me that the
connecting cable is about 50cm long. (Falcon DSP port to the rear connector
on the Jam Pro rack case - with a through plug/socket at the Falcon end)
               Where I want to rack mount the Jam Pro, I need about a 1m
cable, at least, to reach the Falcon.
                Has anyone here any experience of making up a longer cable,
extending the original, or know where I might find one?
                Would the signal degrade with a longer cable?

         Any help greatly appreciated.       Mark.

No experience here, but I did hear a lot of warnings about longer cables. :) IIRC, 1m is already pushing your luck.

The problem is not so much signal degradation, but the fact that the dsp cable is parallel (lots of signal lines working together) and communicates at a very high rate. With a too long cable, the signals won't arrive at the same time (due to capacities and reflections in the cable).

This is why for example a firewire cable (=serial) can be much longer even though the wire quality is about the same and the signal rates are even higher.

Maurits.

Thanks for the clarification Maurits.

Hmmm... I guess I'll have to do a little redesigning.

Mark.

Hi.

Can anyone tell me where is IDE pin no. 1 on Falcon's motherboard
(as it's not marked on my board...)?
Let's assume this is my Falcon:

```
-----------------------------
////////////////////////////
F1 F2 F3 ...
qwerty....
...
... space ..................
-----------------------------
```

Now - with case opened IDE connector (as dots) - falcon in the
same position as above:

```
----------
-----..---
-----..---
-----..---
###
-----..---
----------
```

Now - which is PIN 1? Is it at the top or at the bottom?
Is it on the left or right side?

Thanks.

Adam

PS
Sorry for these "drawings" ;-)

what is an sf314? Is that a floppy drive? A dog nibbled the end of
my floppy PS and I need to wire a new connector so it might be of help
to me!

thanks

kvn

Hello Tim, have you tried to repair them? If the SF314 P/S is Gray colored like the SF314, you may be able to turn it Bottoms Up! On the Bottom are 4 screws. If all that is wrong is a Blown Fuse, you can open it and replace the Fuse. Also, about the 520ST P/S, look on the bottom on the 4 corners, look for Rubber feet and pull them out. If this is the right 520 type P/S, you should be able to stick a screw driver in the hole and open the P/S! If all that is wrong is a blown fuse, try replacing it. Good Luck!

==Thanx==

Yes the SF314/354 are 3.5" Floppy Drives.  My PS has a female connector end,
so it plugs into the drive which has a male port.  I also another drive that
has the reverse orientation.  What is yours?

well let me tell you what I did this afternoon. I took a PS cable that plugs into a monitor and cut it in half, plus bared the wires. Then I sliced the black wire and soldered the other two with the ST PS and wrapped the whole thing up in electrical tape. Then I checked to make sure power was getting from the new transplanted plug into the wire leading to the brick... all was good, until I plugged it into my sf314 NOTHING!   I'm thinking now that whoever owned this PS proably fried the brick and the PS is useless. Im hoping the sf314 works, I dont know what to do.... try to buy another ST, try to find another SF314, try to find a PS for the SF314....

Hi I have a SF314 PS and I think the fuse might be blown in mine. The problem is it has some strange looking screws on the botton... they are not phillips, flat, or torx what are they?

thanks

I was able to open my PS, once opened there were two parts (one gold thing and circuit board thing... I dont see a fuse...   what happened?

BTW I opened the it by grinding down a pair of needlenose pliars so they would fit in the holes and using them to turn the strange screws.

I grinded down the sides of a pair of needle nose pliars and I was
able to open the PS.   I did not see any replaceable parts!    Do I
have a non-circuit breaker model or am I missing something?

As far as I know, the gray power supplies for the SF314/354 are all the
same. Maybe if you E-Mail Best Electronics, they could help? ===Ben===

Anyone know if/where I can find software for my ST for SCSI Scanners?
including to use as a Color Photo Copier to print to my Hewlett Packard?
As well as other Software Applications for Color SCSI Scanners? And what
Scanners are supported? is their a list? And where do I find them?
E-Mail preferred. Thanx! ===Ben===

Ben,
Try Homa Systems House:  http://www.geocities.com/nmontaser/
Nova does the Mustek Paragon and HP scanners.
ScanX PRO the UMAX and Microtek scanners.

Hi.

I thing I have done something very reong to my nvram... I have set
```

display mode to something that can not be displayed neither on my
monitor nor tv. Is there any way to reset nvram (something that I
could boot form diskette)?
Thanks,
Adam

Adam,
As I sit here now, I only know of ACC/CPX or interactive programs to set the
NVRAM.
Nothing that will set it automatically without you being able to 'see' the
screen. Let me see what I can figure out that you might be able to work with
flying blind. I do need to know some information.

1. What are you using as a monitor?
2. For your TV, are you NTSC or PAL based?

Brian

Yes there is a program available that you can put in an auto folder on a floppy and it will reset your NVRAM back to default. I cant remember what it is, but I will have it somewhere on one of my CD's. If you cant find it on the net (search for FALCON NVRAM AUTO or whatever) email me, and I will search my CD's for it.

Coda.

Guys,

Thanks! I have cured my falcon!
It's program called boot.tos (I found it in
falcon_nvram.tar.gz archive)
It creates boot floppy that resets vnram.
I have run it in aranym, it created boot diskette
and - guess what - i put it in falcon, turn it on.
nothing happend... but when I turned falcon again
it worked!!!!! nvram has been reset!
Thanks,
Adam

you can use programs like scan-x, sandrine, novascan mustek driver, etc., but it
remember that RAM is crucial-
the more ram you have the bigger the scan is going to be - e.g to scan a4 page in
color you may need about 60-80 mb...

ScanX is what I use and is the best scanning software for the
Atari that I know of. For more info goto:
